

Name	ROHITH KUMAR DUBBAKA	Patient ID	UMRB0071535
Age/Gender	21Years/M	Study Date	11-Aug-2026
Referred Doctor	DR SUHAS MASILAMANI A B	Modality	MR

DEPARTMENT OF RADIOLOGY

MRI LEFT KNEE WITHOUT CONTRAST

TECHNIQUE:

T1-T2-PD-IR sagittals, T1-T2-IR coronals, T2 axials

FINDINGS:

Oblique tear of body and posterior horn of lateral meniscus is seen with parameniscal cyst formation extending lateral to the lateral tibial plateau. Medially parameniscal cyst is extending along the ligament of wrisberg.

Partial thickness tear of posterolateral bundle of anterior cruciate ligament is seen.

Buckling of posterior cruciate ligament is seen.

Alignment of knee joint is normal.

Femur, tibia and fibula are normal in shape and signal morphology.

Patella appears normal in shape and signal morphology.

No evidence of synovial effusion.

The rest of the anterior cruciate ligament is normal in shape and signal morphology.

Medial meniscus is normal in shape and signal morphology.

Medial collateral ligament appear normal.

Lateral collateral ligament appear normal.

Medial and lateral patellar retinaculum are normal.

The rest of the soft tissues, muscles and fat planes appear normal.
